Introduction to Postilion beta

Welcome to Postilion

Below you find two option buttons. The first lets you select the language of the user interface! (currently only Swedish and English are implemented but it is easy to add more). The button below that lets you disable those changes messages that will appear whenever you start a new version of Postilion. Probably you want to see them, but the choice is yours. The 'Continue' button removes this window and starts the real Postilion program.

FEATURES

Postilion is a graphical Mail User Agent (MUA) which handles MIME. It is mainly written in C but the user interface is done in tcl/tk. The following is a non exhausting list of the capabilities:

* Multilingual interface
  Currently English, Swedish and Italian are supported but it is not hard to add more languages.

* MIME support
  Understands incoming text/plain, image/gif and message/rfc822 content-types. These are decoded (if Quoted-printable or Base64) and shown (if the charset is compatible). Of multipart the multipart/mixed and multipart/alternate types are handled, all other multiparts are treated as mixed. All other content types are represented by an icon and can be either run through appropriate mailcap command, viewed as is or saved to file.

Language: English

Changes messages: Do show
